

How Might We Workshop - Output

Team 27 · Grand Prix Ticketing Redesign · Sprint 1, Week 2

Facilitator: Matthew (Kar Wei) Kwong (Business Analyst) · Card T6 · 4 hours

1. Inputs - friction themes from Week 1 research

A - The on-sale window fails under peak load. A Ticketmaster outage delayed the 2025 on-sale, queues exceeded 100,000, and the event sold out in under an hour.

B - Pricing was opaque and lost trust. Demand-based pricing sold tickets above face value and was dropped for 2026 after public criticism.

C - Buyers cannot tell what they are buying. General admission is around \$120 against a grandstand seat at \$400+, and grandstands do not always give a better view.

2. Opportunities considered

ID	Opportunity	What we would build	Feasibility
A1	Prepare before the gates open - decide what you want before the on-sale so the purchase is one tap	Saved shortlist on the buyer's account, ready when tickets drop	Yes - entirely ours
A2	Honest queue - show real position and expected wait so buyers do not refresh and lose their place	Queue status view with position and ETA	Weak - queue is not ours
B1	True total up front - show the all-in price including fees before committing	Price breakdown on every ticket	Yes, but thin alone
B2	Is this a fair price - context on what the ticket cost previously	Comparison against last year's equivalent	Only with invented data
C1	What this ticket actually gets you - show exactly what each ticket admits you to	Detail view: days, zone, what is and is not included	Yes
C2	Compare side by side - weigh two or three tickets without leaving the page	Comparison view	Yes
C3	What you would actually see - picture the view from a given seat	Circuit map with zones plus a view description per zone	Mostly - photos are the constraint
C4	Help me choose - answer a few questions and get pointed to the right ticket	Short guided finder ending in a recommendation	Yes

3. Shortlist

C1 and C2 were taken forward together as a single feature rather than two - browse ticket types, see exactly what each admits you to, and compare two or three side by side. C3 and C4 were parked as Sprint 3 refinements built on the same foundation.

Why this was chosen

Strongest evidence. Theme C is the only documented friction sitting in a stage we can influence. Themes A and B are the promoter's pricing policy and Ticketmaster's infrastructure - we can design around them but we cannot fix them.

We control the whole thing. No payment gateway, no client system access, no real inventory required. It runs on Firestore and the authentication already built.

It demonstrates. A client can watch someone choose a ticket confidently in ninety seconds, which is what Sprint 2 is assessed on - whether the core idea functions.

It has somewhere to go. C4 and C3 become Sprint 3 refinements rather than scope that has to be cut.

4. Not shortlisted

A2 - Honest queue

We do not control the queue. Anything built would be a simulation of a system owned by Ticketmaster, so there is nothing to validate against and nothing real to demonstrate. Six weeks would produce a convincing mock of someone else's infrastructure, and the client's first question would be whether it works with their actual on-sale - to which the answer is no.

B2 - Is this a fair price

Its entire value rests on historical pricing data we do not have and would have to invent. A feature whose core content is fabricated is worse than no feature.

A1, B1, C3, C4

Considered and not carried into Sprint 2. A1 remains the strongest option outside Theme C if a non-C candidate is needed later. B1 is better folded into a larger feature than built alone. C3 and C4 are parked for Sprint 3.

5. Session record

Date: 26 August 2026

Attendees: Kartikey Dagar, Matthew (Kar Wei) Kwong, Toby Davies, Blake Leonard, Julius Ross

Method: Reviewed the three research themes, worked through the prepared candidate opportunities, and narrowed by discussion.

Acceptance criteria

- ✓ Friction themes converted into How Might We statements
- ✓ Whole team participated in the prioritisation
- ✓ Top opportunities documented with rationale

Done: Turned the three Week 1 friction themes into How Might We statements and ran the team through the candidate opportunities. Shortlisted one browse-and-compare feature, seeing exactly what each ticket admits you to and compare two or three side by side is chosen because it's the only documented friction in a stage we control and needs no payment gateway, client access, or real inventory. Rationale documented for both the shortlist and the discarded options.

Deliverable: How Might We workshop output, committed to the team repository.

Note for Next Role: UX; the feature merges two opportunities (ticket detail view + side-by-side comparison), so treat it as one flow. Ticket attributes vary widely (GA ~\$120 vs grandstands \$400+, differing by days, zone, and inclusions), so the comparison view must hold several attributes cleanly. Two Sprint 3 refinements (circuit map with per-zone views, guided finder) are parked on this feature leaving a foundation they can slot into.
