

Key Interactions and Flows for UI/UX

End to End Flow

Main Path

Ticket list; ticket details (modal); add to cart or buy now; checkout; pay now; payment processor.

Design Decisions

Add to Cart

Keeps the user able to easily continue to browse other tickets. It updates the badge over the cart icon and displays a small confirmation toast.

Buy Now

Takes the user straight to checkout to reduce friction if they are certain they are not interested in any other tickets.

Backtracking

Each step of the ticketing process can be backtracked; the ticket list has a back arrow to return to the dashboard, the modal has an “X” to close it, and the checkout has a return to dashboard button. The cart would remain persistent through browser cookies.

Ticket List

Ticket Cards

Each ticket has a badge in the top left for an incentive on top of an image of the view the customer can expect. The name of the ticket overlays the same image, but in the bottom left. A “sold out” label would be put over the top of this picture and the “view details” button disabled. Underneath, the starting price is shown and to the right, the zone and dates. A small description about exactly why the customer would want this ticket in particular is below along with a view details button.

View Details

This opens the detailed modal so the user can more closely view details about the ticket and are prompted with the option to make their purchase. The list view behind it remains in place.

Right Side Panels

These remain out of the way to avoid interrupting the purchase flow whilst remaining informative to the user about what tickets they've already purchased.

Ticket Detail Modal

Header

The ticket name sits in the top left with its badge beside it. The "X" in the top right closes the modal and returns the user to the ticket list. Underneath, a short summary of key details about the ticket is to the left, whilst the starting price, zone, and dates are aligned to the right. These elements all stay fixed at the top, so the key details are always visible.

Visual Aid and Descriptions

The image on the left shows an expected view that the customer could expect with this ticket. The text pieces on the right explain where the zone is and what the customer can expect to see and experience from their seat.

What's Included / What's Not Included

These sit side by side at the bottom left so the customer can see exactly what they are paying for and what they would need to buy separately.

Purchasing

The dropdown sets how many tickets the customer wants. The selected quantity carries through to the cart and checkout. Add to Cart adds the tickets, updates the cart count via a badge, and shows a small confirmation toast, so the customer can keep browsing. Buy Now skips straight to checkout. If the ticket type sold out while the modal was open, a banner at the top would read "The ticket is no longer available. View other options."

Checkout

Header

The back arrow in the top left returns the customer to the previous screen, so they can return to viewing more tickets. The Garage logo sits in the centre and the customer's name and profile icon are shown in the top right to confirm who is purchasing.

Review Order

The left panel lists each ticket in the cart using the same card style as the ticket list, with the badge, view image, name, description, zone, and date. Under each one, the quantity dropdown and price per ticket are shown, and changing the quantity updates the totals immediately. Remove Item takes the ticket (of all quantities) out of the order entirely. If the last ticket is removed, the message "Your cart is empty. Browse tickets to add to your order" would be shown with a link back to the ticket list.

Your Tickets

The center panel collects the attendee's details: email, first name, last name, and phone number. All fields are marked with an asterisk to show that they are required. The phone field has a country code selector defaulting to the user's geolocation country code. The form will not submit if any field is missing or invalid. Marketing emails are optional. Agreeing to the Terms and Conditions is required (and link – as signified by the underlined styling – would open in a new tab).

Payment Method

The customer chooses either Card or PayPal; this choice decides which payment processor they are sent to. The order summary lists each ticket with its price, followed by the subtotal, GST (10%) and the order total in AUD (would be based on the customer's geolocation). Pressing "pay now" checks that all required fields are complete, the terms are accepted, and a payment method is selected. If anything is missing, errors are shown and the first invalid field is focused. If everything is valid, the customer moves on to the payment processor. On mobile displays, screens the three panels stack into a single column for responsiveness.
