

Key Interactions and Flows for UI/UX

End to End Flow

Compare Path

Ticket list; check two or three tickets to compare; ticket comparison (modal); review differences side by side; change quantities and add any to cart; pay now; payment processor.

Comparing Tickets

Selecting Tickets

A checkbox beside each ticket's "view details" button lets customers select tickets while browsing. Compare sits in the right sidebar and activates once two or more tickets are selected.

Comparison Cards

Each column covers the same ticket card structure: ticket name, key feature description, starting price, zone and date, as well as an additional section from the ticket detail view: what's included.

Loading, Empty, Error States

Loading replaces all elements of each card with glinting placeholder blocks in the same positions and sizes to prevent cumulative layout shifts, so the grid holds its shape whilst data arrives. On error, a small descriptive appears with a button to retry getting the failed information. On empty – ticket sold out – a small description explaining so will appear.
