

Divergence between Approved and Built UI/UX

Design Comparison

Colour Scheme

Target UI mockup has a striking red, black, white colour scheme, whilst the achieved implementation uses a soft green with a prominent amount of light grey to separate subsections. Red was chosen specifically as the primary colour due to its associations with speed and the fact that it aligns with the current F1 logo. The choice of green deviates from this standard. However, both designs pass WCAG AA for small text and WCAG AAA for large text, so accessibility is not an issue.

Browse Tickets Page

Layout

The implemented layout appears cleaner with better readability of certain details, but misses key design choices. No ticket in the implemented design has an image associated with it (even as a placeholder). This was an essential part of the target design as it was one of the key points the redesign was trying to resolve: the user being unsure with what they are buying. The labelled incentive tags on top of the images also appear missing in the implementation.

Other

The target design was made to show explicitly for which event the tickets on screen were currently being sold for (the Australian Grand Prix), as seen with the hero banner next the top of the page. This is missing in the implemented design and instead replaced with very small paragraph text. The navigation sidebar also lacks highlighting the current page that the user is on, which the target mockup included.

Ticket Details Modal

Layout

The implemented design appears more spacious and utilises more horizontal space compared to the target, mostly due to the missing space allocation for an image of the ticket view. The mockup was designed around this constraint of needing to efficiently convey all necessary information in a compact way, which the implementation fails to do.

Other

As well as the image of the view being missing from the implemented design, the most essential buttons – quantity selection, add to cart, and buy now – are completely missing, offering no way for the user to buy a ticket. Additionally, some text (the headings in particular) appears to use a font size that's too small and don't appropriately draw the attention of the user. Similarly to in the browse tickets page, the incentive tag of each ticket type is missing from this modal.

Compare Tickets Modal

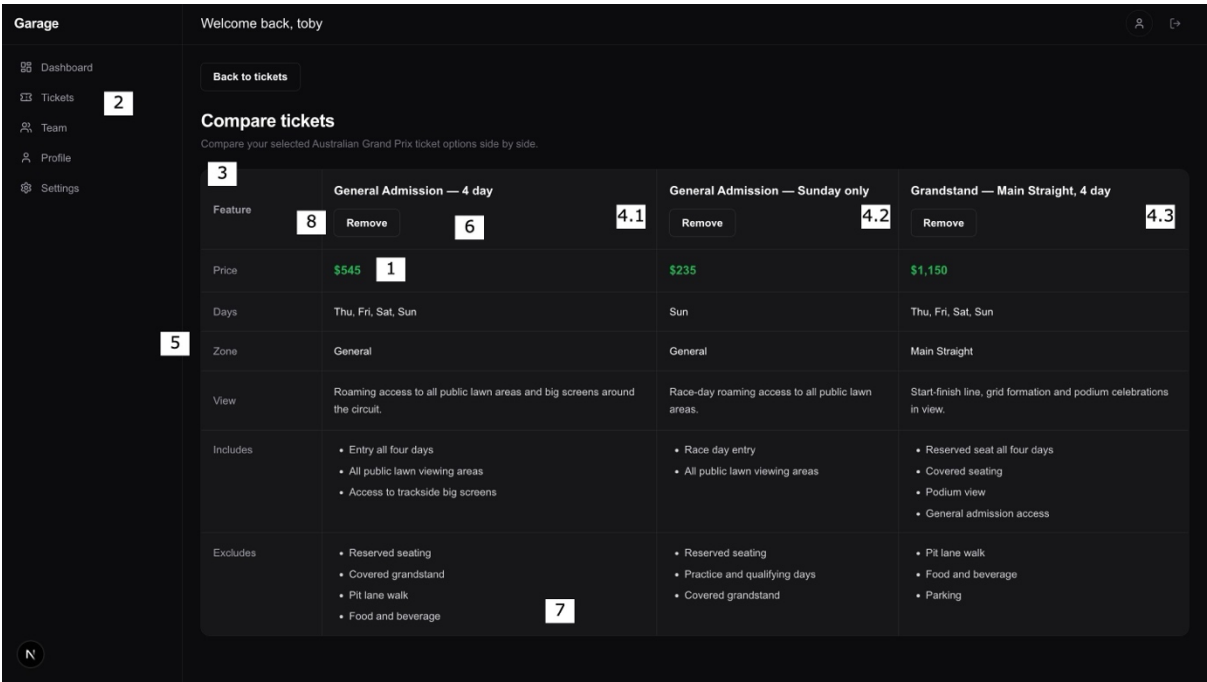

Layout

The UI mockup was intended to be a popup modal that would appear over the browse tickets page; however, the implementation has interpreted it as being a separate page. The table design of the implementation feels lacking in character and rigid compared to the target mockup. The table also fails to enforce the same width on all columns, resulting in a weighted, imbalanced feeling. The table design also includes redundant information which risks overwhelming the user (the headings column down the left side).

Other

The implemented page again lacks an image of the view which the mockup included as well as the ability to buy tickets via an add to cart button. However, the implemented design includes a button to remove its associated ticket from the comparison which the mockup did not include; this is a good change and great feature to add.

Difference Highlighting for Compare Tickets Screen

1. Colour scheme appears as green not red
2. Navigation sidebar does not show highlighted option for the page that is currently open
3. Ticket comparison is stuck in rigid table
4. Sizing of columns uneven
5. Table headings that overwhelm user with additional information that can be intuitively understood
6. Each ticket is missing a space for a picture of the view (even as a placeholder)
7. Missing a quantity selector and add to cart button
8. Positively improved design by adding a remove ticket from comparison button
