Addressing Visual Artefacts and Inconsistencies

Visual Consistency Pass

All screens use a dark theme, noted in the CSS as “asphalt.” The design is cohesive across most pages of the ticket design with few exceptions. The red used in the home and sign in screen, whilst adhering to the initial colour scheme of the mock-ups, now feel out of place due to the lack of red on all other screens. The most efficient fix I can suggest is to remove the red and white alternating track outline pattern from the bottom of these first two screens. The yellow highlighting (denoted as “gold” in the CSS) on the ticket comparison screen also feels out of place due to the distinct lack of yellow introduced in other pages. It would be worth considering changing this to a light green perhaps. The chosen font remains consistent as well as other typography properties; font weights, sizing, styling. Navigation remains intuitive and familiar across each section, and buttons and other styling remains similar.

[See appendix for screen references]

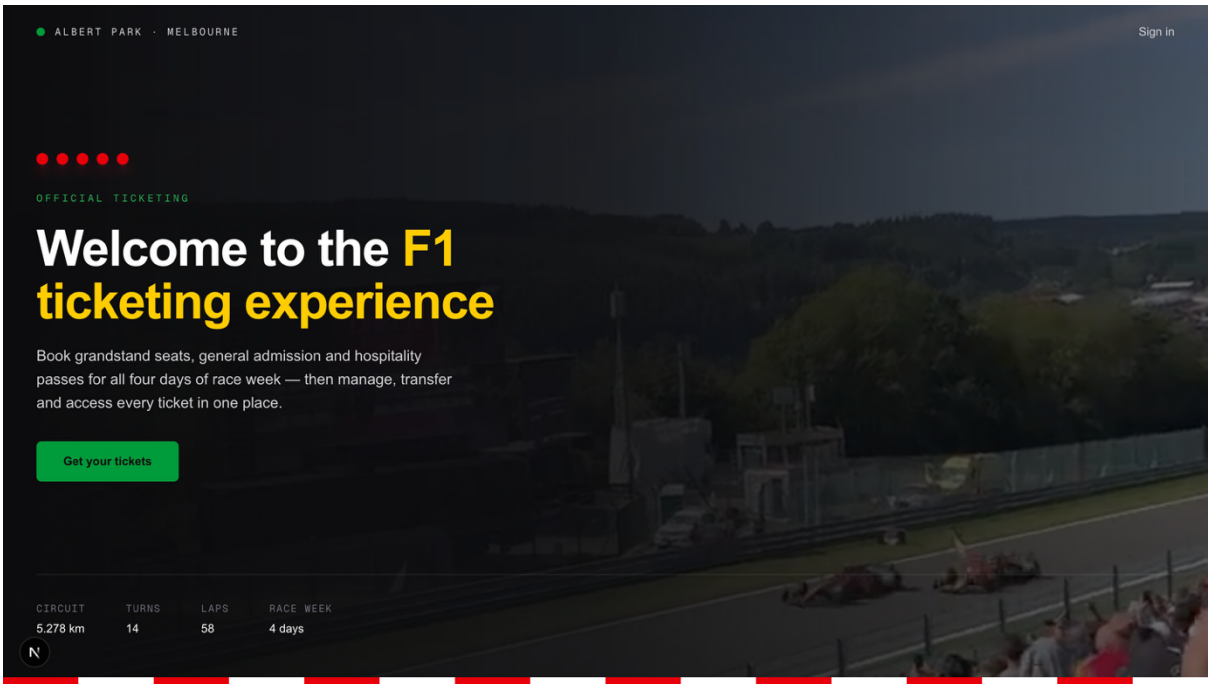

Dashboard Responsiveness Failure

The project manager has said the “right column currently clips off-screen” on the dashboard grid. This finding has not been able to be replicated on any screen size tested – ranging from several mobile devices up to multiple desktop sizes. The grid nature of the dashboard seems to appropriately and accurately handle varying screen dimensions. In the event that this is still a problem, the right-side column should responsively move to be underneath what would previously be described as the left side, so that it becomes stacked vertically rather than overflowing horizontally.

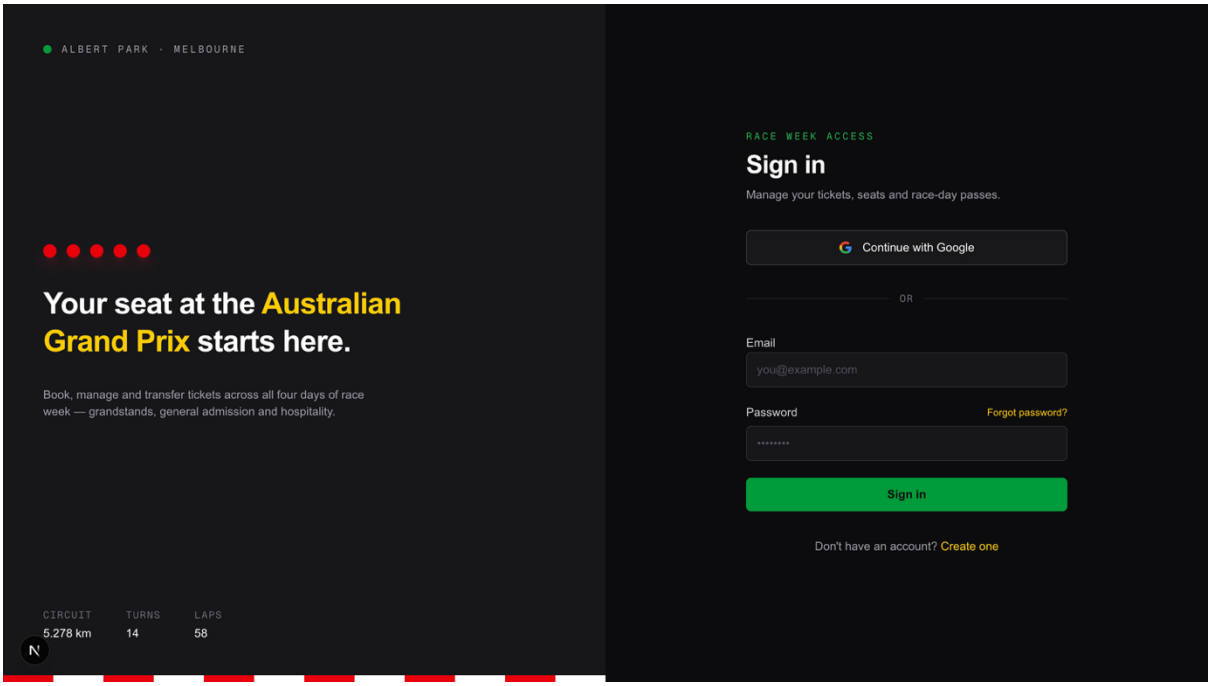

Event Banner Frame

An example of what could fill the event banner on the browse ticket page was provided in the sprint 2, week 1 mock-up (see appendix). But for additional clarity I could suggest any of the following: a picture of the host city’s skyline, a view of the track, a shot of the main entrance.
